1. SUMMARY

PM10 exceedances recorded in the San Joaquin Valley on October 25, 2006 meet the criteria for natural events as defined by federal policies. Several factors contributed to the total PM10 concentrations. Monitoring stations in the Central San Joaquin Valley recorded gusty wind speeds to 45 mph during a time of year when the soils in the area were very dry and dust could be entrained into the atmosphere by high winds. This report demonstrates without the natural event, there would not have been an exceedance of the PM10 National Ambient Air Quality Standard on October 25, 2006.

A blowing dust event is comprised of entrainment of dust by high winds in the dust source area, and then deposition of dust in receptor areas with lower wind speeds. Once dust is suspended upwind of the monitoring stations, it can be carried downwind by winds that are below the dust entrainment wind speed threshold. The strongest winds and blowing dust was observed to north and west of Corcoran. The blowing dust was transported to the southeast where deposition occurred in Corcoran and Bakersfield and other parts of the Central and Southern San Joaquin Valley, where the wind speeds decreased, but continued to be much higher than normal.

The District investigated emission-generating activities during the episode, and found PM10 emissions for BACM controlled sources were approximately constant before, during and after the event. The District concludes that the PM10 exceedance would not have occurred without the wind-entrained dust event.

2. BACKGROUND

The San Joaquin Valley Unified Air Pollution Control District (District) adopted its *Natural Events Action Plan (NEAP) for High Wind Events in the San Joaquin Valley Air Basin* in February 2006. The 1996 EPA memorandum, *Areas Affected by PM10 Natural Events*, describes the requirements for natural event data flagging as well as the requirements for a NEAP. The policy allows air quality data to be flagged so that it does not count toward an area's attainment status if it can be shown that there was a clear, causal relationship between the data and one of three categories of natural events: volcanic and seismic activity, unwanted wildland fires, and high wind events.

The purpose of this report is to demonstrate that there was a clear, causal relationship between the exceedance of the PM10 standard on October 25, 2006 in the San Joaquin Valley Air Basin and a high wind event, and demonstrate that without the high winds, PM10 would not have exceeded the standard. Although a combination of several factors contributed to the total PM10 concentrations, the District concludes that the exceedance would not have occurred in the absence of high winds.

Data flagging serves multiple purposes. According to the 1986 U. S. Environmental Protection Agency (EPA) guidance document, *Guideline on the Identification and Use of Air Quality Data Affected by Exceptional Events*, knowledge and understanding of what data represent are critical in the overall air quality process. The major thrust of a data flagging system is information exchange, and data flags are meant to prevent the misuse of data. Flagging the October 25, 2006 exceedance will ensure that the data is not misinterpreted.

3. NEAP CRITERIA

The NEAP requires the District, in consultation with California Air Resources Board (CARB) meteorologists, to declare a NEAP episode if the following criteria are met:

- 1. There has been no recent, measurable precipitation in the potential source region for fugitive dust**
- 2. The National Weather Service in Hanford and/or Sacramento has issued either a High Wind Warning, Wind Advisory, or Blowing Dust Advisory for certain parts of the San Joaquin Valley, and the predicted duration of high winds is sufficient to establish a NEAP episode**
- 3. The surface weather maps show a potential for high winds to occur in the near future.**
- 4. Strong winds exist higher in the atmosphere in conjunction with other weather phenomena that can drive the higher wind speeds closer to the surface**
- 5. The 24-hour average PM10 level is forecast to be above the National Ambient Air Quality Standard at one or more San Joaquin Valley sites.**

On October 25, 2006, all of the NEAP criteria were met:

Criteria 1. Precipitation had not been reported in the valley for ten days prior to the event. Precipitation was much below normal in the San Joaquin Valley for five months prior to the blowing dust event.

Criteria 2. The National Weather Service in Hanford issued a short-term forecast predicting areas of blowing dust would reduce visibility to 1 mile in some locations in the Central and Southern San Joaquin Valley.

Criteria 3 and Criteria 4. Strong winds were reported in the San Joaquin Valley Air Basin.

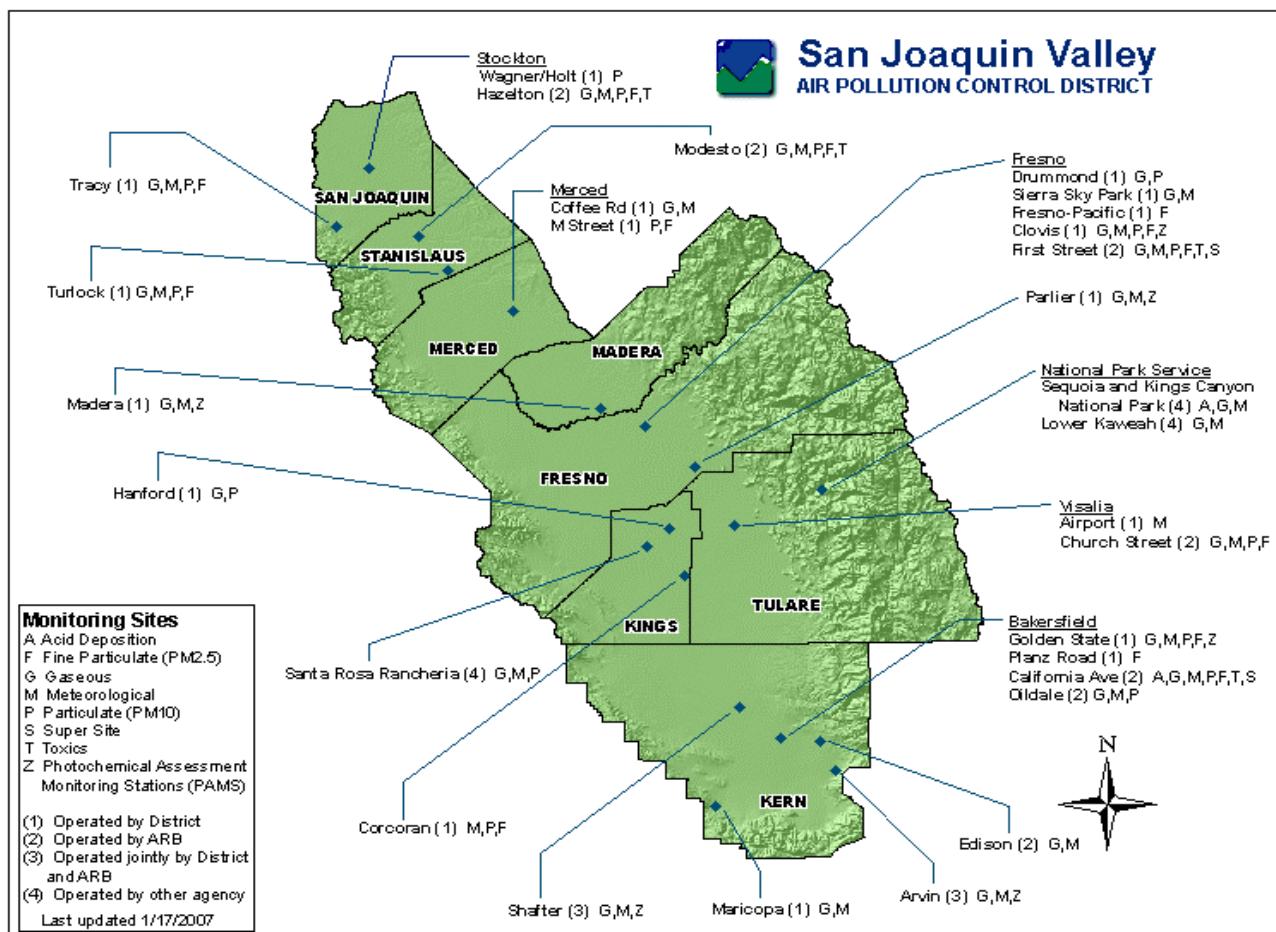

Criteria 5. The PM10 National Ambient Air Quality Standard (NAAQS) was exceeded at Bakersfield and Corcoran.

A press release was issued on October 25, 2006 with the goal of notifying the public of the natural event in order to protect public health. This press release is provided in the appendix.

4. SUMMARY OF THE NATURAL EVENT

On October 25, 2006, PM10 samplers recorded concentrations in excess of the 24-hour NAAQS for PM10 in the San Joaquin Valley. The NAAQS is 150 $\mu\text{g}/\text{m}^3$ rounded to the nearest 10 $\mu\text{g}/\text{m}^3$. A map of San Joaquin Valley monitoring stations is provided in Figure 1.

Figure 1. San Joaquin Valley PM10 monitors.

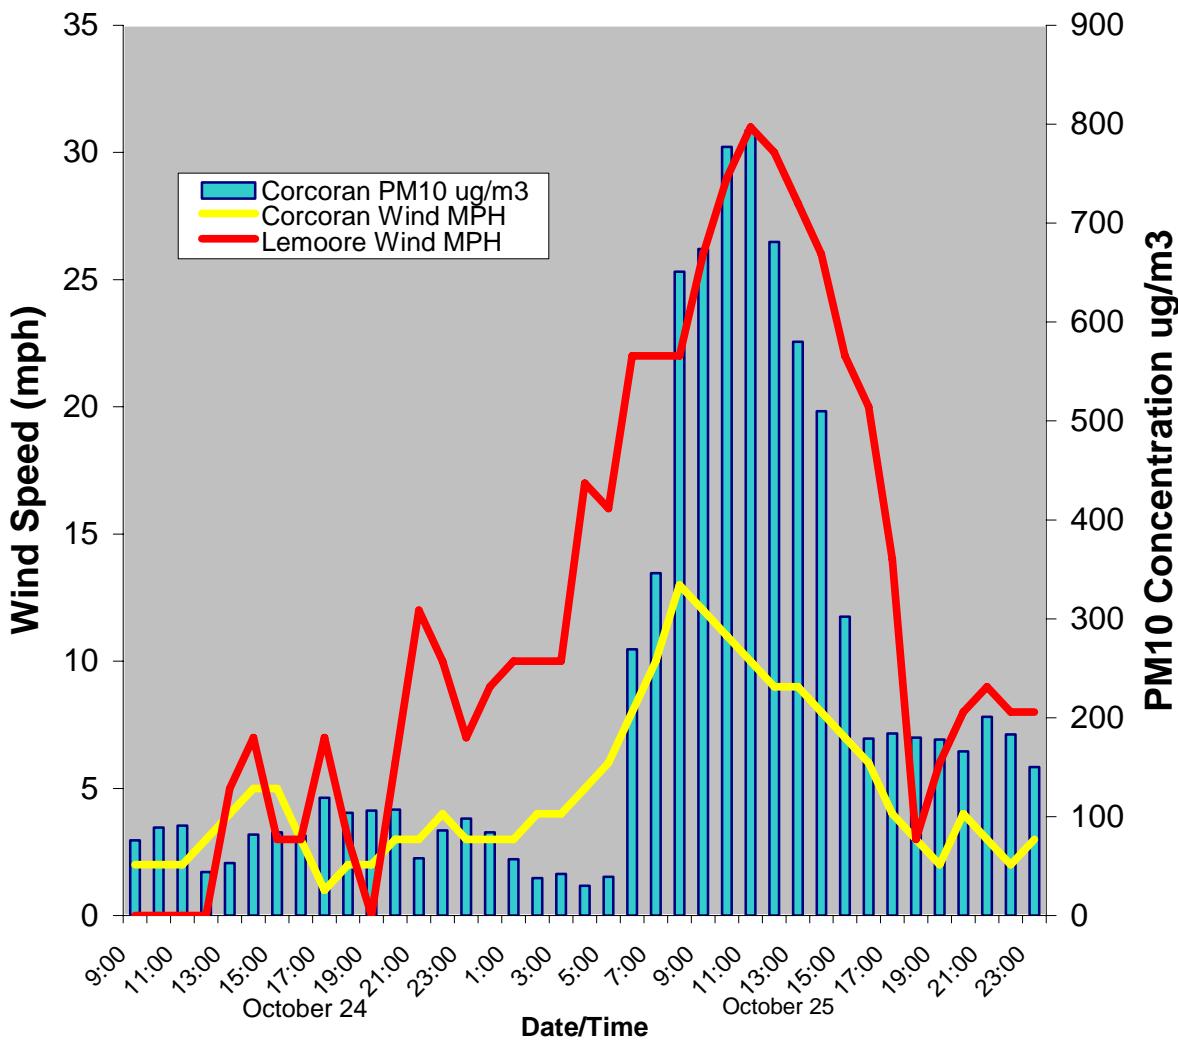

PM10 concentrations for continuous samplers are shown in Table 1. The PM10 concentration exceeded the NAAQS at Corcoran and Bakersfield-Golden State Highway on October 22. As shown in Table 1 and Figure 2, PM10 at Corcoran rapidly increased from 39 $\mu\text{g}/\text{m}^3$ at 5 AM to 269 $\mu\text{g}/\text{m}^3$ at 6 AM and continued rising to 651 $\mu\text{g}/\text{m}^3$ at 8 AM, coinciding with a significant increase in the wind speeds in the vicinity of Corcoran. A report for the San Joaquin Air Quality Study Agency (Bush, 2004)

concluded that winds at speeds at 8 m/s (17.6 mph) could be sufficient to entrain surface soil into the atmosphere.

Hour 0 is Midnight to 1 AM, Pacific Standard Time - For Kettleman Hills, Hanford, Lemoore: G = Hourly peak gust, Sustained wind is a 10 minute average at beginning of hour - For Corcoran, wind speed is an hourly average. M = Peak minute average for that hour

Corcoran wind speed is an hourly average. Lemoore wind speed is a 10 minute average at the beginning of the hour.
10 minute averaged wind speed may be higher than an hourly averaged wind speed at the same location.

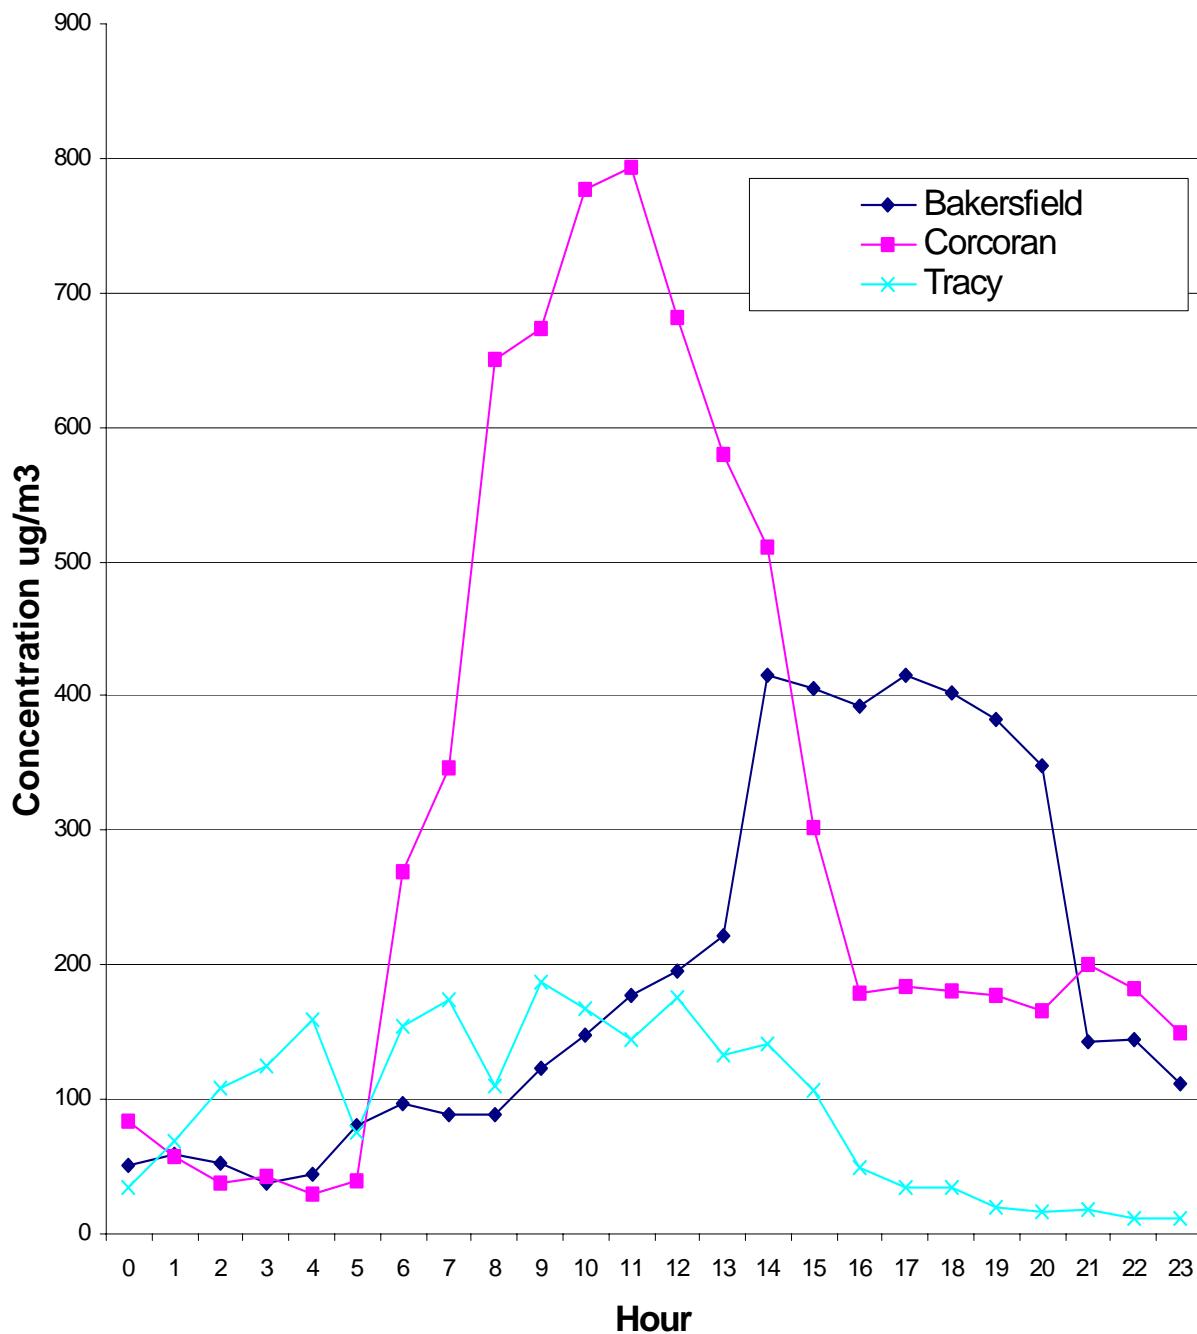

Figure 2. Time series plot of Corcoran and Lemoore wind speed and Corcoran PM10 for October 24 and 25, 2006.

Wind monitoring stations in the vicinity of Corcoran reported strong gusty winds from the northwest on October 25, 2006. A peak gust of 30 mph was reported at Hanford at 10 AM and a peak gust of 40 mph was reported at Lemoore at noon and 45 mph gust was reported at Kettleman Hills at 1 PM. Figure 3 is a map showing that these stations are

in the vicinity of Corcoran. Lemoore reported wind gusts of 30 mph or greater from 7 AM to 3 PM on October 25, 2006. Kettleman Hills reported wind gusts of 20 mph or greater from 3 AM to 6 PM. PM10 concentrations at Corcoran remained above 500 $\mu\text{g}/\text{m}^3$ for 7 hours (from hour 8 through hour 14).

Figure 3. Map of California, showing San Joaquin Valley Air Basin boundary in blue.

**Figure 4. Plot of PM10 on October 25, 2006**

As shown in Figure 4, the dust plume arrived later at Bakersfield and at a lower concentration, and remained above 300 $\mu\text{g}/\text{m}^3$ for 7 hours (from hour 14 through hour 20). PM10 dropped below 200 $\mu\text{g}/\text{m}^3$ by hour 16 at Corcoran and by hour 21 at Bakersfield. Figure 4 also demonstrates that the duration of the dust event was the same in Corcoran and Bakersfield.

PM10 remained in the 100 to 250 $\mu\text{g}/\text{m}^3$ range into the morning hours of October 26, 2006, as shown in Table 2, indicating that PM10 remained suspended after the winds decreased.

Hour 0 is Midnight to 1 AM, Pacific Standard Time

The District collects hourly PM10 concentrations using two types of PM10 monitors, Tapered Element Oscillating Microbalance (TEOM) type monitors and Beta Attenuation Mass (BAM) type monitors. EPA certifies TEOM type monitors to be equivalent to FRM monitors (EQPM-1090-079). EPA does not consider BAM monitors to be equivalent to FRM monitors. BAMs are used for forecasting purposes, but are not used for attainment determinations. Data recorded by continuous analyzers is presented Table 3, which

shows the increase in daily averaged PM10 data on October 25, 2006 due to the blowing dust event. PM10 concentrations remained high on October 26. Much lower PM10 concentrations are evident before the blowing dust event (October 20 to 24, 2006). Filter based measurements for October 20 and 26, 2006 are presented in Table 4. Filter based measurements were made every six days in October. The District will submit particulate data into the CARB database by the required deadline. The Santa Rosa Rancheria Tribal EPA operates the Santa Rosa Rancheria monitor. The October 26, 2006 sample at was invalidated by the Santa Rosa Rancheria Tribal EPA, due to construction dust emissions produced near the monitor.

5. METEOROLOGICAL DATA

The following meteorological information is presented to demonstrate that the NEAP meteorological flagging criteria were met.

Criteria 1 - No recent, measurable precipitation in the potential source region for fugitive dust

Precipitation and temperature data is provided to demonstrate that the period preceding the blowing dust event was much drier and hotter than normal. Moisture content of soils is a very significant factor in a blowing dust event. Soils that have lower than normal moisture content during the driest time of the year would be more easily entrained by strong winds. The above normal temperatures dried soils to a greater degree than normal and below normal precipitation contributed to drier than normal soils. Soil and crop maps are provided for reference in the appendix.

Precipitation

There had been 11 consecutive days without measurable precipitation before the October 25, 2006 event. As shown in Table 5, precipitation was much below normal in

Table 5. Days with precipitation recorded at Hanford, Bakersfield and Fresno for five months prior to October 25, 2006 (precipitation in inches).

Date	Hanford	Bakersfield	Fresno
October 14, 2006	0.01	0	0

% of normal precipitation, June - October, 2006	15%	54%	9%

the San Joaquin Valley for five months prior to the blowing dust event (9 to 54 percent of normal for June to October). Because the Southern San Joaquin Valley reported much below normal precipitation before the dust event, the soils were dry enough to become entrained into the atmosphere during the high winds. Figure 5 is a map of

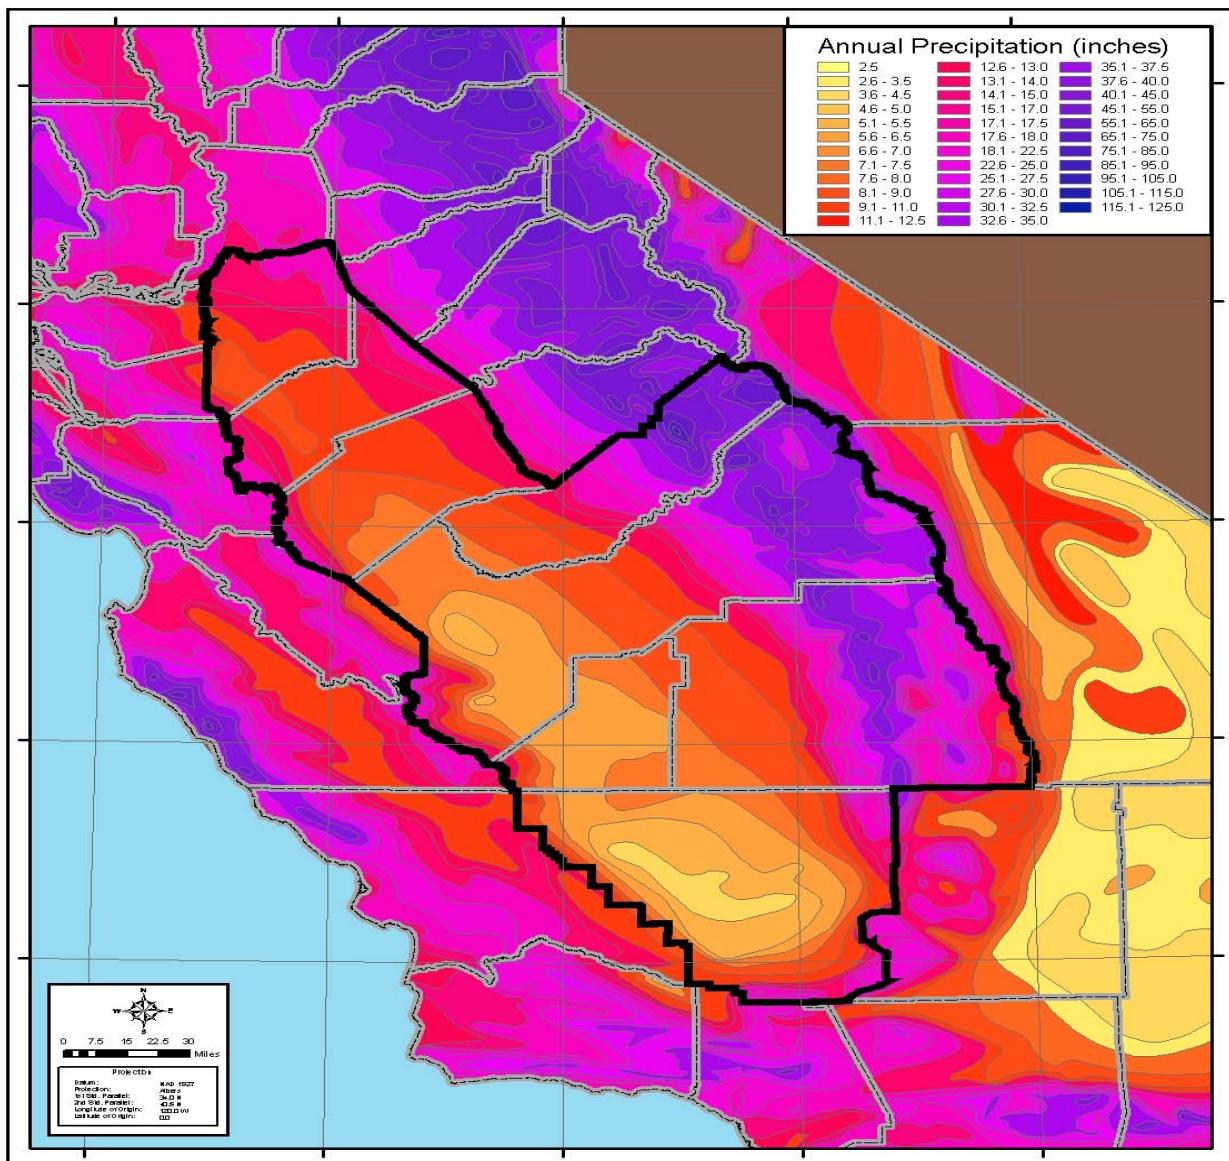

Figure 5. Central California annual precipitation in inches. The San Joaquin Valley Air Basin is outlined in black.

annual precipitation for the San Joaquin Valley Air Basin. The map demonstrates that the west side of the Central and Southern San Joaquin Valley has the lowest annual precipitation of any area west of the Owens Valley, Mojave Desert and Antelope Valley. Since the west side of the valley has the lowest annual precipitation in the San Joaquin Valley, and the undisturbed soils, on the average, are drier than other parts of the valley. The 'west side of the valley' is well known locally as a source location of blowing dust events.

Record summer heat

Record heat dried the soils. The spring and summer of 2006 was extremely hot. Table 6 indicates that mean temperatures in Fresno and Bakersfield were above normal in every month from May 2006 to September 2006. Table 7 indicates that June through September is the hottest time of year with maximum temperatures above 90 degrees F. In the last half of July, record heat was recorded, which resulted in a large number of heat related deaths in the San Joaquin Valley. The National Weather Service monitoring stations at Hanford, Bakersfield and Fresno reported 14 days in a row with temperatures over 100 degrees F. Fresno reported five days in a row of 112 F or greater during the heat wave at the end of July. These data indicate that the hottest and driest time of year preceded the October 25 wind event, and that it was excessively hot in the spring and summer 2006.

Table 6. Departure from average monthly temperature (degrees F).

August 2006	96	97
September 2006	91	91

Criteria 2 - The National Weather Service in Hanford has issued High Wind Warning, or Blowing Dust Advisory for parts of the San Joaquin Valley

The National Weather Service in Hanford, CA issued a short-term forecast at 9:13 AM on October 25, 2006 predicting blowing dust in the Central and Southern San Joaquin Valley (see Figure 6).

Figure 6. Forecast issued by the National Weather Service in Hanford, CA on October 25, 2006.

.NOW...NORTHWEST WINDS 10 TO 20 MPH WITH GUSTS TO 35 MPH MAINLY
ON THE WEST SIDE OF THE VALLEY WILL CONTINUE THROUGH 1100 AM.
AREAS OF BLOWING DUST WILL REDUCE VISIBILITY TO 1 MILE IN SOME
LOCATIONS. MOTORISTS SHOULD USE CAUTION AND REDUCE SPEED
WHEN ENCOUNTERING AREAS OF BLOWING DUST.

The National Weather Service and the San Joaquin Valley Unified Air Pollution Control District received reports of blowing dust in Avenal, Harris Ranch and Corcoran on October 25, 2006. Figure 7 is a map showing the location of Avenal, Harris Ranch and the Corcoran air monitoring station.

Figure 7. Map of Central California, showing Corcoran, Avenal and Harris Ranch.

Criteria 3 and 4 - Strong winds

As shown in Tables 8, 9, 10 and 11, strong gusty winds occurred in many parts of Central California during the October 25, 2006 event. In addition, the high winds persisted for many hours. The high wind event resulted in entrainment of dust followed by deposition of dust as the plume moved southeast through the San Joaquin Valley, from the West Central San Joaquin Valley to the Southern San Joaquin Valley.

During the blowing dust event, Lemoore reported sustained NW winds to 30 mph with gusts to 40 mph. Kettleman Hills, located on the west side of the San Joaquin Valley, reported gusts of 20 mph or greater from 3 AM to 6 PM on October 25, 2006.

Table 8. Peak wind speeds for October 25, 2006, recorded by National Weather Service stations.

Monitoring Station	Peak Gust (mph)	Peak Sustained Wind (mph)
Fairfield/Travis AFB	51	37

Hourly averaged wind speed is typically much lower than peak gust

Data source: District and CARB

NA - Not Available

Table 11. Hourly averaged wind data for October 25, 2006, from California Irrigation Management Information System (CIMIS) monitors in the Corcoran area.

Monitoring Station	Location	Peak Hourly Averaged Wind Speed (mph)
Five Points	NW of Corcoran	24.2
Five Points SW	NW of Corcoran	16.8
Stratford	WNW of Corcoran	22.4
Kettleman	WSW of Corcoran	19.6
Alpaugh	SE of Corcoran, Between Corcoran and Bakersfield	13.5

Hourly averaged data is typically much lower than peak gust. Sensor height is 2m above ground level (AGL). Wind speed measured at 2 meters would typically be lower than wind speed measured at 10 meters at the same location.

Long-term wind monitoring data from the Department of Water Resources measured on the southwest side of the San Joaquin Valley indicates that hourly averaged winds above 13 mph hour occur 3.7 % of the time in Taft and winds above 16 mph occur 1.6% of the time in Wasco and 3.3 % of the time in Coalinga. These statistics indicate that windy conditions are rare in the southwestern part of the San Joaquin Valley, but do occur at times. Department of Water Resources extreme annual wind statistics indicates that the mean annual peak gust for Lemoore is 42 mph. For this event, the peak gust was 40 mph at Lemoore.

Wind monitoring sampling parameters

Wind monitoring sampling parameters vary with sensor height and sampling and averaging interval. To make a meaningful comparison of wind speed between locations, the wind monitoring should have consistent sampling height and averaging interval. Unfortunately, wind sensor heights and averaging periods vary with network and station, as presented in Table 12. Wind measurements for air quality monitoring are typically made at 10 meters above ground level.

Monitoring Network	Sensor Height (m)	'Sustained Wind' Definition	'Gust' Definition
District and CARB	10	Hourly or Minute Average.	Gust Not Reported
National Weather Service AWOS/ASOS	9 to 10	10-Minute Average.	3 Second Average
RAWS	6	10-Minute Average	Instantaneous Peak
CIMIS	2	Hourly Average	Gust Not Reported

Table 12. Wind monitoring network sampling parameters.

Variation in wind speed averaging interval

A comparison of shorter time scale and longer time scale wind measurements is provided in Table 13. The ratio of shorter time scale and longer time scale peak wind measurements was calculated using October 25, 2006 data presented in Tables 8, 9 and 10. This comparison indicates that maximum minute averaged wind speed collected on October 25, 2006 by the District and CARB was 40 percent higher than maximum hourly averaged wind speeds. Maximum three second averaged wind speeds were 30 percent higher than maximum 10 minute averaged National Weather Service data. Instantaneous peak wind speeds at RAWS stations were 56 percent higher than ten minute averaged wind speeds.

Monitoring Network	Ratio	Data Set	High	Low	Average
District and CARB	<u>Minute Average</u> <u>Hourly Average</u>	Table 10	1.78	1.21	1.40
National Weather Service AWOS/ASOS	<u>3-Second Average</u> <u>10-Minute Average</u>	Table 8	1.39	1.19	1.30
RAWS	<u>Instantaneous Peak.</u> <u>10-Minute Average</u>	Table 9	1.77	1.30	1.56

Table 13. Ratio of shorter time scale and longer time scale wind measurements

As presented in these data comparisons, caution should be exercised when comparing wind statistics from different stations because hourly averaged wind speeds can be significantly lower than the peak gust. For example, the peak hourly averaged wind speed in Corcoran during hour 8 on October 25 was 13 mph and the peak minute averaged wind speed was 18 mph for that hour. Instantaneous peak wind gusts were likely much higher than the minute and hourly averaged wind speeds.

Variation in wind speed with height

Over a flat surface with no obstructions and a well-mixed atmosphere, wind speed typically varies logarithmically with height above ground (Department of Water Resources, 1978). This relationship can be modeled using the equation:

$$V_1 / V_2 = (Z_1 / Z_2)^p$$

where:

V = wind speed,

Z = height above ground,

p is approximately 0.143 for flat terrain and 0.4 for rough terrain,

and the subscripts 1 and 2 denote two different sampling heights above ground level (AGL). It should be noted that there are some weather conditions where this equation is not representative of the vertical wind structure.

Using this equation, a wind speed of 13.5 mph at 2 meters AGL in flat terrain would be 16.9 mph at 10 meters AGL at the same location. This equation indicates wind speeds measured at 2 meters is typically much lower than wind speed measured at 10 meters at the same location.

For example, the Alpaugh CIMIS station reported a peak hourly averaged wind speed of 13.5 mph at 2 meters AGL (see Table 11). Using the equation provided for flat terrain, the hourly averaged wind speed at 10 meters AGL would be 16.9 mph. If the minute averaged data was 40 % higher than hourly averaged data, as shown in Table 13, the peak minute average would be 23.7 mph. The instantaneous peak gust at 10 meters AGL at Alpaugh was likely higher than the minute average of 23.7 mph and higher than the 18 mph dust entrainment threshold.

6. SOURCE-RECEPTOR RELATIONSHIP

Figure 8 is a backward trajectory analysis using the NOAA Hysplit Numerical Model to examine the air parcel trajectory during the event.

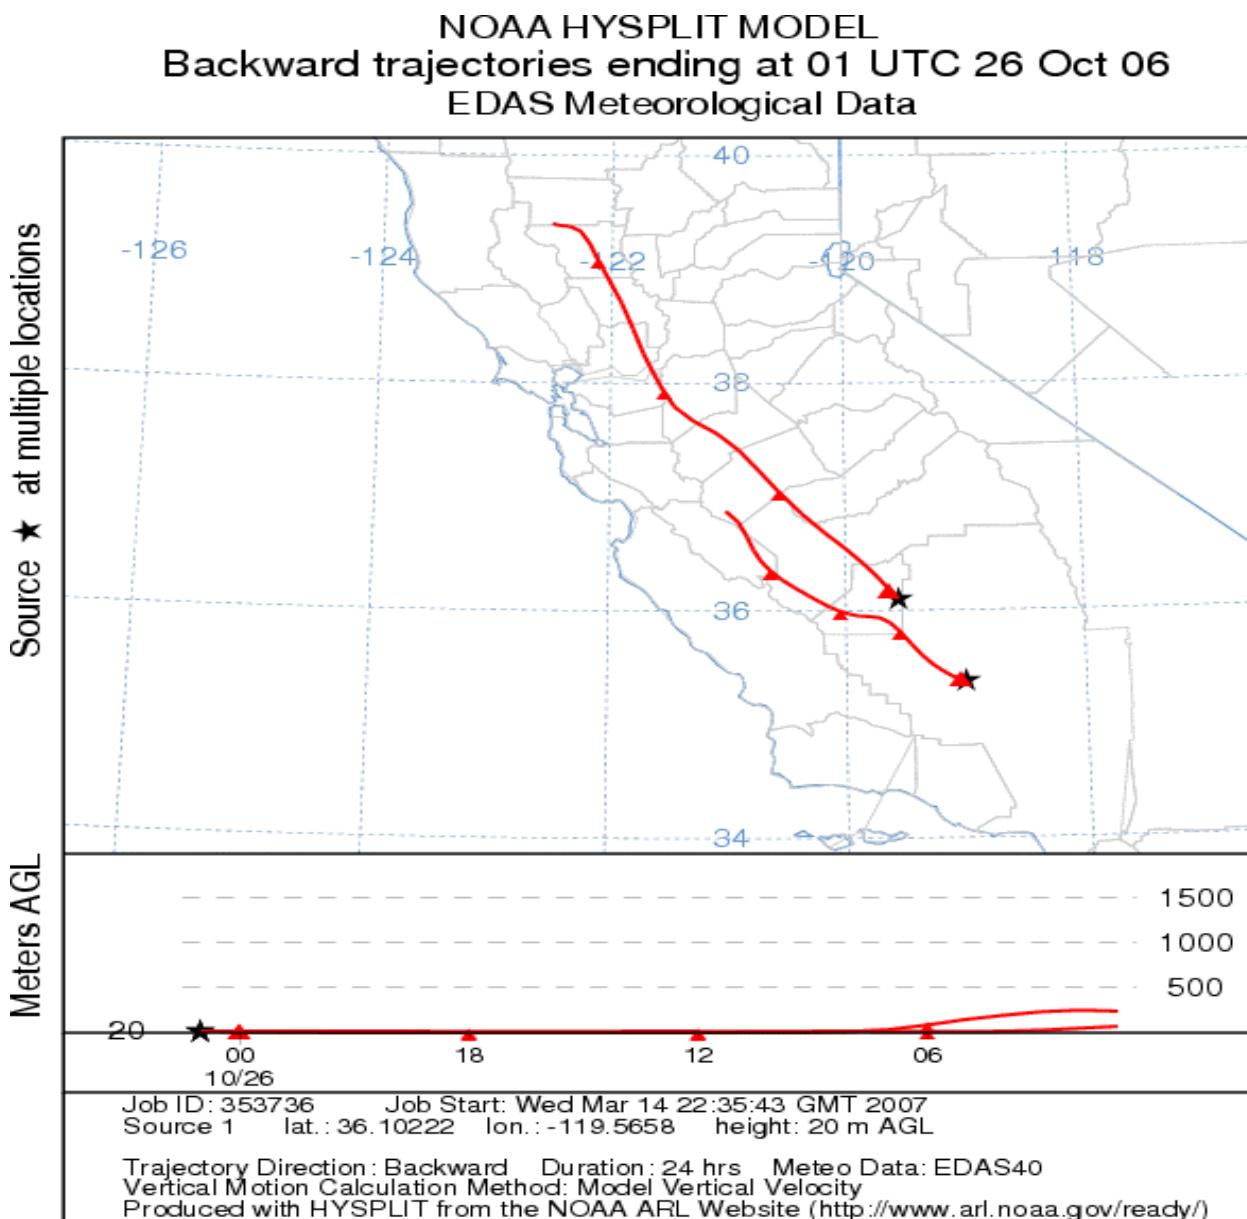

Figure 8. Backward trajectory for 5 PM PST on October 25, 2006, showing air parcel trajectories to the Corcoran and Bakersfield receptors during the blowing dust event.

The blowing dust originated in the vicinity of Kings County or western Fresno County, based on observations of blowing dust at Avenal, Harris Ranch and Corcoran (see Figure 7), and strong gusty winds reported at Kettleman Hills, Hanford and Lemoore. The model trajectory takes the air parcel over Western Fresno County and Kings County, where the blowing dust was reported, to the Corcoran and Bakersfield particulate monitors. Winds were from the northwest during the blowing dust event, so the dust plume first influenced the Corcoran monitor and then traveled southeastward where it influenced the Bakersfield monitor several hours later, as shown in Figure 4. With time, the plume spread throughout the Central and Southern San Joaquin Valley, as evidenced by high PM10 at the Fresno-First Street monitor on October 25 and high PM10 reported by the continuous analyzers and the filter based measurements on October 26. The Northern San Joaquin Valley does not appear to have been as influenced by the dust plume as the Central and Southern regions.

The PM 2.5 to PM10 ratio was very small during the high PM10 event (the ratio was approximately 0.02 to 0.10), which is characteristic of a blowing dust event and indicates mostly coarse particulate was present.

7. EMISSIONS SOURCES AND ACTIVITY DATA

The District has best available control measures (BACM) in place as described in the *2006 PM10 Plan*, the NEAP, and previous plans. Most notable among the District's dust controls are Regulation VIII (the fugitive dust rules, which were last amended in August 2004), and Conservation Management Practices (CMPs, District Rule 4550, adopted May 2004 and re-adopted August 2004), through which the District has CMPs on over three million acres of agricultural land in the San Joaquin Valley Air Basin.

On October 25, the Silver Prescribed Fire in Sequoia Kings Canyon National Park burned six acres producing 1.05 tons of PM10 and 0.94 tons of PM 2.5. This fire was about 50 miles west of Corcoran and about 75 miles north-northeast of Bakersfield, so this smoke would not have influenced Corcoran and Bakersfield.

Agricultural burning was permitted in the San Joaquin Valley on October 25, 2006 as part of the District's Smoke Management Allocation System (Rule 4103); however burning was not allowed in the Corcoran or Bakersfield burn zones. Smoke from agricultural burns and prescribed fire does not appear to have added any significant amount of PM10 to the samples recorded at Corcoran and Bakersfield.

District inspectors performed facility inspections on October 25. District staff did not observe any unusual emissions other than the blowing dust event on October 25. A summary of inspections is provided in the appendix. Based on reports from District field staff and from industry and agricultural operations, the District estimates that the anthropogenic emissions were approximately constant before, during and after the event, indicating the significant increase in PM10 concentrations was caused by the wind entrained dust. A summary of the dust and smoke related complaints in the Central and Southern San Joaquin Valley Air Basin is provided in Table 14.

Location	Time Reported	Nature Of Complaint
Kettleman City	8:49 AM	Fire Marshall reports burning grass.
Tulare	10:17 AM	Burn at farm contains plastics.
Bakersfield	1:30 PM	Dust caused by trucks at construction site.
Kerman	4:02 PM	Burn in front yard.
Panoche Road and I-5	10:50 PM	Burning without a permit. A Notice of Violation was issued.

Table 14. Summary of dust-related complaints for October 25, 2006.

9. APPENDIX

9.1 Press Release and News Articles

PRESS RELEASE
Issued late morning on October 25, 2006

High winds prompt health warning

Air pollution levels climbing; caution urged throughout the San Joaquin Valley

Strong winds in many parts of the San Joaquin Valley have prompted local air-pollution officials to issue a health cautionary statement effective through 10 a.m. Thursday.

The winds are kicking up particulate matter ten microns and smaller, or PM10, which could pose a threat to public health.

"Depending on where you are and what the local conditions are like, the airborne dust and dirt could be at concentrations that are unhealthy," said Gary Arcemont, a meteorologist for the Air District.

Air District employees in the field today have noted blowing dust in several parts of the Valley, and so residents throughout the Valley are urged to use caution.

Exposure to particle pollution can cause serious health problems, aggravate lung disease, cause asthma attacks and acute bronchitis, and increase risk of respiratory infections. In people with heart disease, short-term exposure to particle pollution has been linked to heart attacks and arrhythmias, according to the U.S. Environmental Protection Agency.

People with heart or lung diseases should follow their doctors' advice for dealing with episodes of unhealthy air quality. Additionally, older adults and children should avoid prolonged exposure, strenuous activities or heavy exertion. Everyone else should reduce prolonged exposure, strenuous activities or heavy exertion.

On Feb. 16, 2006, the Valley Air District's governing board approved a Natural Events Action Plan (NEAP) that outlines a protocol to inform the public when unusual natural events occur. The purpose of the plan is to identify and minimize public exposure to these unusual events. The full text of the NEAP is available online at http://www.valleyair.org/Air_Quality_Plans/docs/NEAP.pdf.

The Valley Air District covers eight counties including San Joaquin, Stanislaus, Merced, Madera, Fresno, Kings, Tulare and the valley portion of Kern. For more information, visit <http://www.valleyair.org/> or call the nearest District office: Modesto (209) 557-6400, Fresno (559) 230-6000 and Bakersfield (661) 326-6900.

NEWS ARTICLES

Wind gusts prompt air warning

By Doane Yawger

Merced Sun-Star Thurs., Oct. 26, 2006

Winds were blustery in Merced County for much of the day Wednesday but did very little damage.

Peak wind gusts of 36 mph were recorded between 10 a.m. and 11 a.m. at Merced Municipal Airport and continued in the upper 20s until about 5 p.m., tapering off to 5 mph in the evening hours, according to the National Weather Service.

Strong winds in many parts of the San Joaquin Valley prompted local air-pollution officials to issue a health cautionary statement. The winds kicked up particulate matter 10 microns and smaller, or PM10, which could pose a threat to public health.

RoseMary Parga Duran, associate superintendent of the Merced City School District, said students were advised Wednesday not to run around too much and take it easy, especially those prone to asthma. No wind-related incidents were reported in Merced by elementary and high school officials.

A quick power outage disrupted lunchtime at Don Stowell Elementary School in South Merced but was resolved within a few minutes, Duran said.

Merced city public works crews had to pick up a few tree limbs knocked down by the winds but nothing overwhelming, according to public works official Gordon Gray.

Jeffrey Barlow, lead forecaster for the Hanford-based National Weather Service, said the winds were associated with a cold front that passed through Merced and kept Merced's high temperature at 73 degrees.

No wind-related auto accidents were reported Wednesday by Merced police or California Highway Patrol officers.

Gary Arcemont, a meteorologist for the San Joaquin Valley Air Pollution Control District, said district employees in the field noted blowing dust in several parts of the Valley.

Exposure to particle pollution can cause serious health problems, aggravate lung disease, cause asthma attacks and acute bronchitis, and increase risk of respiratory infections.

In people with heart disease, short-term exposure to particle pollution has been linked to heart attacks and arrhythmias, according to the U.S. Environmental Protection Agency.

Local briefs

Health warning issued for Valley

The Fresno Bee, Thursday, October 26, 2006

Strong winds prompted local air pollution officials to issue a health warning for the central San Joaquin Valley through 10 a.m. today.

The San Joaquin Valley Air Pollution Control District said the winds are kicking up PM10 particulate matter, which are particles 10 microns and smaller. The airborne dust can pose a health threat, said meteorologist Gary Arcemont.

Exposure to particle pollution can cause serious health problems, aggravate lung disease, cause asthma attacks and increase the risk of respiratory infections, according to the Environmental Protection Agency

Wild wind warning

Modesto Bee, Thursday, October 26, 2006

High winds are kicking up dust and pollution throughout the San Joaquin Valley, as seen Wednesday on Carpenter Road above and below, prompting air district officials to issue a health warning. District employees have noted blowing dust in several parts of the valley and urge people to use caution through 10 a.m. today, a San Joaquin Valley Air Pollution District news release said. Depending on where you are, the wind could carry enough dust and dirt to be unhealthy, said Gary Arcemont, a meteorologist for the air district. Exposure to dust and other particle pollution can aggravate lung disease, cause asthma attacks and acute bronchitis, and increase the risk of respiratory infections. People with heart or lung diseases should follow doctors' advice for dealing with unhealthy air when dust is present, the district said.

Older adults and children should avoid prolonged exposure, strenuous activities or heavy exertion.

**EMAIL DISCUSSING PRESCRIBED FIRE
Issued October 25, 2006 10:02 AM**

National Park Service
Sequoia & Kings Canyon National Parks

Update on Silver Prescribed Fire

At the end of the day yesterday, fire crews finished igniting all but 10 acres of the 354-acre Silver Prescribed Fire in the Mineral King area of Sequoia National Park. The final acres will be ignited today and crews will remain in the area to patrol the burn.

Please contact me if you have any questions.

Western Regional Climate Center, wrcc@dri.edu

9.4 Surface Weather Data

Key:

T = Temperature (F)

DP = Dew Point (F)

RH = Relative Humidity (%)

WD = Wind Direction

WS = Wind Speed (mph)

VIS = Visibility (miles)

Wx = Weather

SKY = Sky Conditions

PRESSURE = Surface Pressure in mb and inches of Hg and Altimeter setting

MN/MX T = Periodic Minimum Maximum Temperature (F)

FLAG = Data Quality Control Flag

Prec = Precipitation

G = Wind Gust (mph)

HZ = Haze

BLDU = Blowing Dust

RA = Rain

CLR = Clear

N = North

E = East

S = South

W = West

CIMIS Station Flag Legend		
A - Historical Average	I - Ignore	R - Far out of normal range
C or N - Not Collected	M - Missing Data	S - Not in service
H - Hourly Missing or Flagged Data	Q - Related Sensor Missing	Y - Moderately out of range
Conversion Factors		
Ly/day/2.065=W/sq.m	inches * 25.4 = mm	(F-32) * 5/9 = c
mph * 0.447 = m/s	mBars * 0.1 = kPa	--
